Alfido Tech — Task 4: Website Traffic Analysis

Short report | Traffic logs supplied in traffic.csv

Executive summary

The dataset contains **226,278** events from 2021-08-19 to 2021-08-25: **142,015** pageviews, **55,732** clicks and **28,531** previews. Clicks are 39.2% of pageviews as an event-level engagement proxy, while previews are 20.1%. The data is useful for content and engagement analysis, but it does not contain the identifiers and timestamps needed for true session-level website analytics.

Metric	Result
Total events	226,278
Pageviews	142,015
Clicks	55,732
Previews	28,531
Click/pageview proxy	39.2%
Preview/pageview proxy	20.1%
Unique link IDs	3,839
Users / sessions	Not available

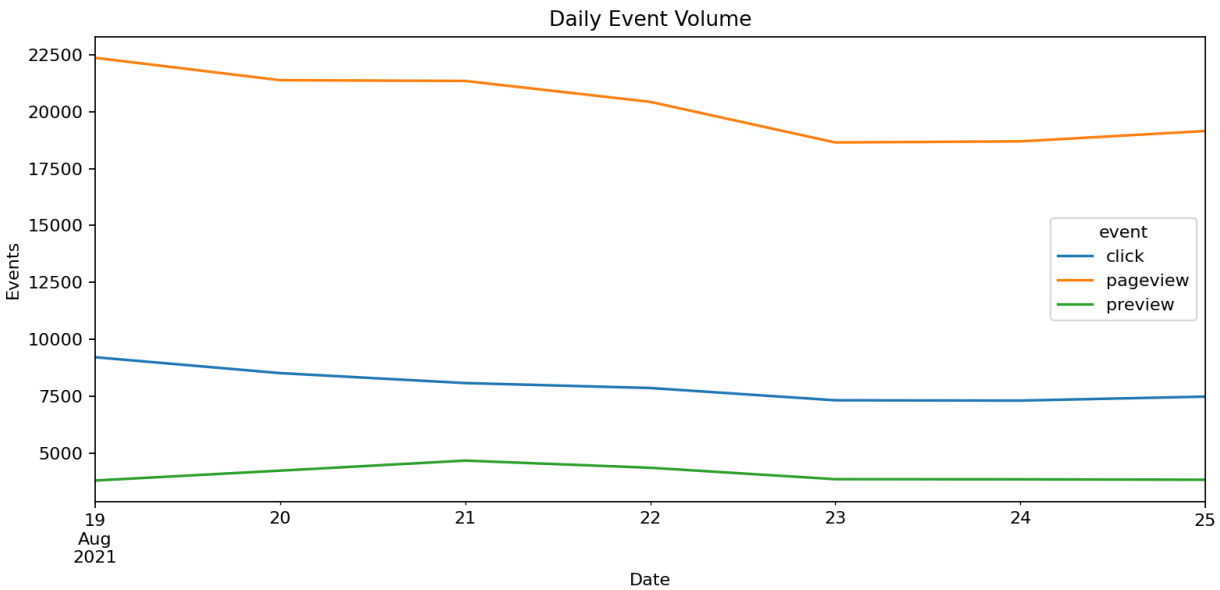

Key insights

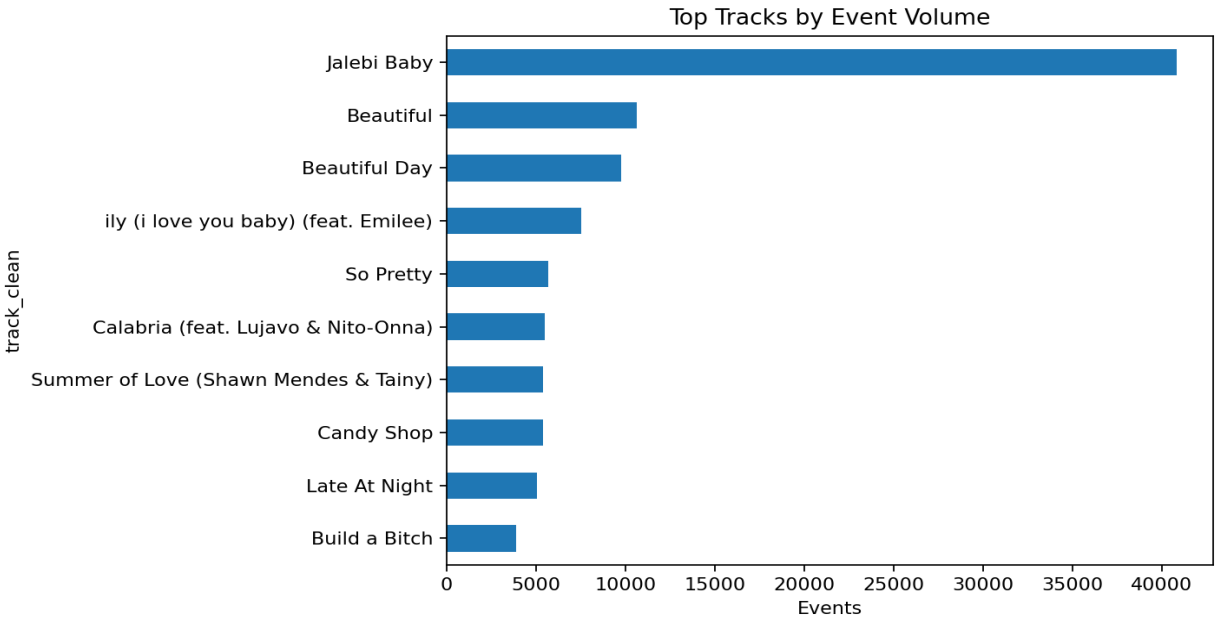

• The dataset has 3,839 distinct link IDs, giving Alfido Tech a content/link-level view of demand.

• The top event-volume country is Saudi Arabia, followed by India and United States.

• The highest-volume track is “Jalebi Baby”, showing where engagement is concentrated.

• True landing-page, exit-page and ordered journey analysis cannot be established because page URL, event timestamp and session/user identifiers are absent.

Five conversion optimizations

1. Implement anonymous user/session IDs and event timestamps to calculate users, sessions, bounce rate and session duration.

2. Capture referrer plus UTM source/medium/campaign and landing URL to compare acquisition channels.

3. Build a measurable funnel: landing → content view → CTA click → lead/demo/contact conversion.

4. Prioritize high-volume content/link pages for clearer CTAs, stronger internal navigation and relevant next actions.

5. Use exit-page and short-session diagnostics once session data is available; A/B test CTA placement, forms, navigation and page speed.

Submission note: The notebook contains the cleaning, metric calculations, visualizations, limitations and recommendations. Upload the notebook and this PDF to GitHub/Google Drive and submit the viewable links under Task 4.
